

# Customer Churn Analysis - Summary and Recommendations

## Objective:

- To identify the key factors contributing to customer churn in a telecom dataset and derive actionable insights to improve customer retention.
- 

## Overall Churn Rate

- Out of the total customer base, **26.54%** have churned.
  - This indicates that nearly **1 in 4 customers** discontinued the service — a significant retention concern for the company.
- 

## Demographic Insights

- Gender:** Minimal influence on churn — both male and female customers churn at nearly equal proportions.
  - Senior Citizens:** Although senior citizens form a smaller part of the customer base, they exhibit a **significantly higher churn rate** compared to younger customers, suggesting age-related dissatisfaction or reduced engagement.
- 

## Tenure Insights

- High churn among new customers:** Customers with shorter tenures (0–12 months) show the **highest churn rates**, especially in the first month.

- **Retention increases with time:** Customers with longer tenures (over 60 months) show **very low churn**, indicating stronger loyalty and satisfaction over time.

## Contract Type Insights

- Customers with **Month-to-Month** contracts churn the most, contributing the majority of total churns.
  - Customers with **One-Year or Two-Year** contracts show much **higher retention** — long-term contracts effectively reduce churn.
  - This implies that longer commitment periods build stability and decrease switching behavior.
- 

## Internet Service Insights

- Customers using **Fiber Optic** services exhibit the **highest churn rate** among all internet types.
  - **DSL** users churn considerably less, while customers with **No Internet Service** have the lowest churn rate.
  - This trend suggests that **Fiber Optic customers may be more price-sensitive or dissatisfied with service quality/performance.**
- 

## Payment Method Insights

- Customers using **Electronic Check** as their payment method show the **highest churn rate (approx. 45–50%)**.
- Customers using **Automatic Payments** such as **Credit Card or Bank Transfer** have **very low churn (around 15–20%)**.

- This indicates that customers preferring **manual or non-recurring payments** are less committed and more prone to discontinuation.
- 

## Key Takeaways

- **Tenure, Contract Type, and Payment Method** are the most influential factors in customer churn.
  - Short-term, new customers paying via electronic checks are the **most vulnerable segment**.
  - Long-term customers on **annual contracts** with **automatic payments** show the **highest retention**.
  - Focusing on **incentivizing longer contracts, promoting auto-payment options, and improving early-stage onboarding** could substantially reduce churn.
- 

## Strategic Recommendations

- Encourage customers to switch from **month-to-month** to **annual or bi-annual** plans through discounts or loyalty points.
- Promote **automatic payment methods** by offering small incentives or exclusive benefits.
- Enhance **early customer experience** (especially within the first 6 months) to reduce early-stage churn.
- Investigate **Fiber Optic service quality and pricing** to understand and mitigate dissatisfaction causes among high-value users.
